NovaTech Systems — IT Support Guide

NovaTech Systems • Internal Knowledge Base Document

Field	Value
Document ID	NT-IT-001
Version	1.7
Effective date	2026-04-01
Owner department	IT Operations
Last updated	2026-04-01
Status	Active

Purpose and scope

Provides practical support procedures and priority expectations for employee technology and access issues.

All names, systems, processes, dates, limits, and examples in this document are fictional and exist only for the NovaTech Systems RAG knowledge-base exercise.

1. Support Model

IT Operations provides support for company-managed devices, approved software, account access, VPN connectivity, MFA issues, onboarding setup, and security-related device events.

2. Priority Levels

Priority	Definition	Expected initial response	Typical examples
P1 — Critical	Business-critical service or broad employee impact	30 minutes	Company-wide authentication outage; major security/device incident
P2 — High	Significant impact to a team or critical individual workflow	2 business hours	VPN unavailable for a delivery team; critical access failure
P3 — Medium	Normal productivity issue with workaround possible	1 business day	Laptop application failure; standard access request
P4 — Low	Minor issue or informational request	2 business days	Non-urgent software request; general how-to

3. Laptop Problems

1. Record the visible error and when the issue started.
2. Restart the device if safe to do so.
3. Check network/power/peripheral connections.
4. Contact IT through the approved support channel if the issue persists.
5. Do not install unapproved drivers, security software, or remote-control tools.

4. VPN Problems

- Confirm the device has working internet connectivity.
- Restart the approved VPN client if permitted.
- Check whether the issue affects one application or all protected resources.
- Provide IT with the timestamp, error message, device identifier, and network context without sharing passwords or secrets.

5. Password Reset and MFA

Use the approved identity-recovery flow. IT will not request the employee’s password or MFA code. If MFA is unavailable because a device was lost or replaced, identity verification and recovery controls must be completed before access is restored.

6. Software Installation

Employees should request software through the approved IT process. Security-sensitive or licensed software may require additional approval. Unapproved software should not be installed on managed devices.

7. Access Requests

1. Identify the system and required role.
2. Provide the business reason and manager/owner information.
3. Complete required approvals.
4. IT or the system owner provisions access according to least privilege.
5. Test access and report any mismatch.

8. New Employee Setup

Standard onboarding includes laptop assignment, account activation, MFA setup, required software, and department-specific access. See NT-HR-005.

9. Lost Laptop

Report a lost or stolen company laptop immediately. Do not wait to determine whether it will be recovered. IT/Security may remotely restrict access, revoke sessions, or initiate device-response procedures.

10. Security Incidents

Suspected malware, credential theft, unauthorized access, or accidental exposure should be reported immediately through the security/incident process. For production incidents, use NT-SRE-001.
